

SAGI

a distributed search for general intelligence

We don't know what AGI looks like. So let's search and own it, together.

A worldwide frontier laboratory where anyone can contribute idle
contribute idle compute. Candidate minds are grown as living
living organisms, evolved on your hardware, and selected for one
one thing: the ability to learn.

Search for Artificial General Intelligence

A distributed research lab that runs an open, evolutionary search for AGI. Lend AGI. Lend your idle compute to an evolving population of candidate algorithms — algorithms — and help find the next generation of AI models.

Distributed compute

Thousands of contributors donate idle idle compute. No datacenter required required — the network is the supercomputer.

Evolutionary search

Genomes are grown, verified and selected. Proof of Useful Work — the the compute is the research, not wasteful mining.

Community-driven

Open participation and shared upside. The search — and what it discovers — belongs to everyone.

- how it works

Two sides of the same coin

THE ENGINE

Evolutionary search

Candidate algorithms are grown, verified and selected across the network. The compute that secures SAGI is the research itself — Proof of Proof of Useful Work, not wasteful mining.

THE SDK

A kit to achieve scale

Games and apps plug in idle compute; developers add new use-cases and environments. A restricted runtime never executes arbitrary code — every integration adds compute, and earns tokens.

more scale → **more search** → **higher odds we find AGI**

- the economy

A token that rewards useful work

Utility token. No premine, no ICO. Capped, decaying emission — accounting, not gambling.

Compute rewards

Contribute verified compute, earn tokens. Reward scales with compute $\times$ usefulness — Proof of Useful Work. Work.

Bounties

Sponsors fund bounties to steer compute toward targeted breakthroughs. Solve them, earn the pool.

EMISSION / EPOCH

Early contributors earn more; tapering shifts the network from growth to efficiency incentives — better algorithms, not just more hardware.

SAGI

- roadmap

Start now. Build in the open.

Support the search with your idle compute. Help find the next AI models.
